

Next Generation Gaskets

Liquid Contract Gasketing

- No retooling
- No equipment to buy
- Fine-tuned precision
- Digitally designed
- Robotically applied

The basics...

One of the most basic business practices is to maintain your competitive edge by seeking higher margin products and processes.

How are you making gaskets?

Die cut, extruded, laser and waterjet cut, molded, and other methods. To profitably serve your customers, you probably use as many methods as you can.

Next generation technology

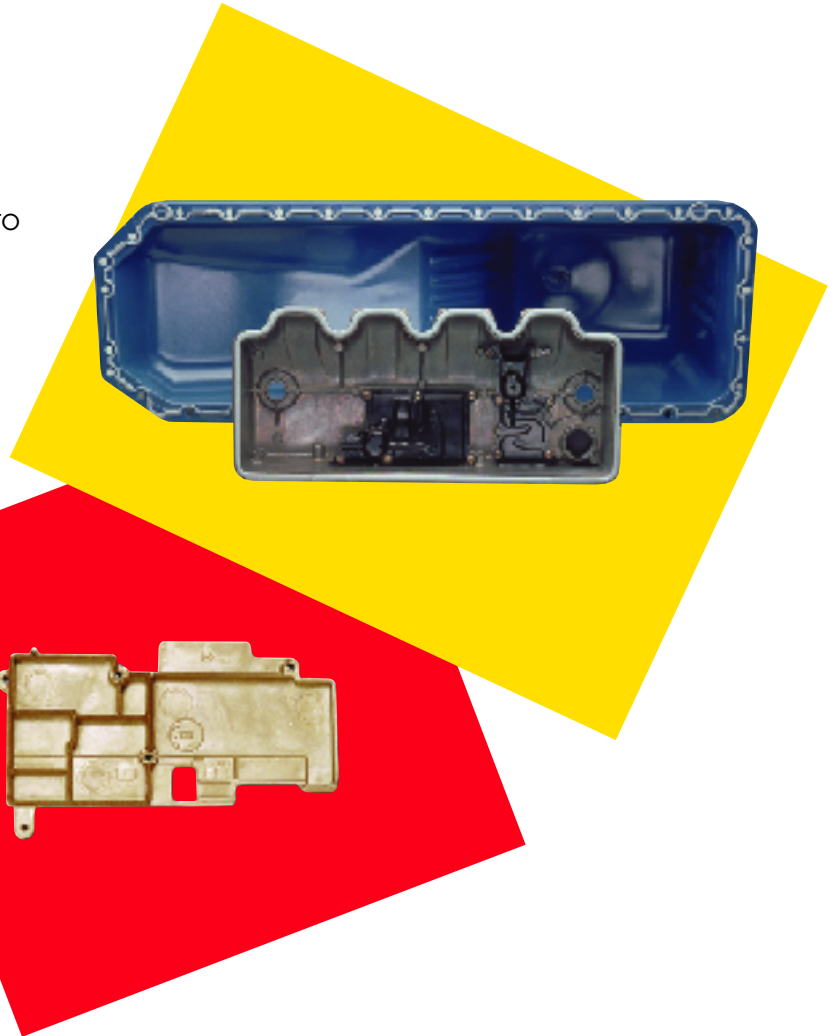

Liquid form-in-place gasketing is a robotically applied gasketing process. We program the robot controller to apply highly precise gasket paths. The gasket adheres to and becomes integral with the part. The result is high value-added gasketed parts with exacting placement part after part.

ContractGasketing.com provides the gasketing service. There's no retooling, so setup takes only hours instead of weeks!

We can be invisible to your customers. We offer the option to drop-ship.

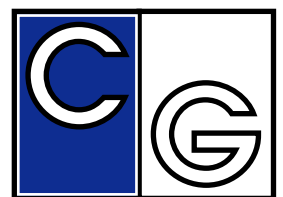

We can dispense most materials

- Silicones
- Urethanes
- Foams
- EMI/RFI shielding
- And many others
